

Blushield Tesla Large Area Model

Instructions for use

Plug the power pack into an existing socket in a central part of the area to be protected, if there is a switch at the wall socket. Make sure this is switched on. Take the small end plug and insert it into the socket on the case, just so it is a firm fit. Do not exert too much pressure on the plug. It may not appear to be all the way into the socket, this is acceptable. The LED light flash intermittently every half minute or so through a small 1mm hole above the socket. This model has the new multi-wave waveform producing a symphony of frequencies to combat EMF at a cell level, rendering this model the best protection Blushield has released to date. The area to be protected is a 90 metre radius from the point of plug in. This model is ideal for large area protection in a warehouse or large office. Ideal for 5G.

As long as the Blushield Cube/Ultra is left plugged in, it will affect all people within the field range. The Blushield will penetrate normal floors and walls (Gibraltar board or wooden). A normal size house would only require one unit. In multi-storey office buildings one per floor or more than one per floor may be required depending on area to be covered. When deciding on a position, remember that it is designed to affect people not equipment, so place in a central area.

Once the Blushield is plugged in, a LED will light every half minute or so. If this does not light up, then check the power switch. Make sure that the unit is plugged in correctly. Use a dedicated plug point try to avoid plugging into a power board with multiple plug outlets.

The Blushield is safe to use with computers and will not erase data as the Blushield is non-magnetic. The Blushield does not emit any electromagnetic fields (EMF) so does not generate interference which might affect sensitive equipment, including pacemakers. Blushield complies with EMC emission standards EN 50082-1:1992 and EN 50081-1. Blushield meets electrical safety standard NZ/AS 3100.

Make sure that this model is not plugged in your bedroom as the flashing light, like any lighting, may interfere with getting to sleep. Though most people do not report detox symptoms, some do in the initial first few days after installing the Blushield. This detox – beneficial though sometimes slightly uncomfortable - is a transient condition and will pass within a few days. This is the body adjusting to a new environment. People who have very poor health may take longer to adjust, in some cases up to 4-6 weeks.

The Blushield is not an ionizer. Blushield does not remove EMF nor does it modify EMF, therefore using an EMF meter will not indicate any change in the environment. Therefore a gaussmeter, dirty electricity meter, radio frequency meter or any other device that measures human-made electromagnetic energy will not indicate the actual neutralisation of the electrical fields as Blushield works at the biological level, internal to the cell. Blood tests were used to determine the effectiveness of Blushield technology. Blushield is not a therapeutic device and must not be sold as one. Any health benefits derived from the use of this device are purely consequential and no medical claims are stressed or implied.

The Blushield Tesla large area models are guaranteed against faulty parts or workmanship for a 1-year period from date of purchase. This does not cover wear and tear, neglect or misuse of the product. Warranty does not cover lightning strike or power surges. The Blushield Tesla large area models may need to be repaired after a powerful power surge, in which case the customer has to pay any and all costs relating to the repair or replacement of the product. However, this has not occurred as yet.
